

Stay Systems Announces Call For Beta Test Users For Online Property Management System

2007-11-10

Qualified Participants to receive one year use of StayManager.com at no charge

Stay Systems, LLC announced today that the company's StayManager system is available for beta testing. Qualified users participating in the beta test will have access to the system for free for 12 months after the general availability of the system, which is expected on January 1, 2008.

StayManager.com is an online/hosted hotel software system with serious functionality for small hoteliers, including bed & breakfasts and boutique properties. StayManager.com provides a state-of-the-art commission-free online booking tool along with reservations, front desk, accounting, administration and credit card processing (via PayPal). See www.staysystems.com for more information.

'We are delighted to announce the availability of our product for beta,' stated Paul Murray, Director of Operations. 'We have been working on the development of the product for slightly more than four years and are excited about getting feedback from the hotelier community,' added Murray. 'Likewise, we invite consultants and re-sellers to test drive the system for themselves as we plan to build market share through re-sellers on a country by country basis', stated Murray.

StayManager is an online system that supports any language and any character-set at the user login-level, making it unique in its ability to allow hotelier's to manage multiple properties in different countries with diverse teams of people. A single hotelier can use one product to manage multiple properties in countries supporting English, Spanish, Polish, French, German or any language with non-western alphabets such as Arabic, Cyrillic, Hebrew, Chinese, Japanese, etc.

'We use an American Express bank approved facility for hosting to provide operators with expertise and security features they might not be able to afford themselves. For clients that prefer to host the systems themselves the entire hosting platform is portable and can easily be installed on any Windows(TM) or Linux(TM) environment', continued Murray.

Stay Systems understands the need for larger hoteliers to host StayManager themselves. 'We get significant feedback from the IT staff at larger hotels telling us that they simply will not compromise on the issue of hosting. They have to host it themselves behind their firewall with their infrastructure. We incorporated research from the field into our development plans', stated Murray, 'and as a result our system is built to be deployed using an N-Tier architecture utilizing industry standard application server and database technology from Sybase, Inc.'

StayManager.com has complete functionality that includes a powerful graphical room chart, auto-assigned rooms, individual and group reservations, move room, switch room, move folio, split folio, currency conversion, VAT support, and much more.

Hoteliers interested in participating in the beta test should visit <http://www.staysystems.com/beta.htm> for more information.
